***Drawings***

1. The drawings were received on January 27, 2009. These drawings are acceptable for examination.

**EXAMINER'S AMENDMENT**

2. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Mr. Peter Michalos on March 13, 2009. The application has been amended as follows:

- In claim 15, line 3, following the text "at least one switching device (4)" please insert "for switching".
- In claim 18, line 3, following the text "at least one switching device (4)" please insert "for switching".

***Allowable Subject Matter***

3. Claims 2, 3, and 7-20 are allowed. The following is an examiner's statement of reasons for allowance:

As for **claim 2**, the prior art of record fails to sufficiently describe or suggest a method for securing a vehicle against theft wherein at least one essential operational element of the vehicle can be switched between three operating states A, B, and C and is switched between

these operating states according to the following steps: (a.)the essential operational elements are switched into a substantially unrestricted operating state A by an external usage authorization device which is not a key or a fob device and is independent of the vehicle, over means for transmitting the authorization data; (b.)at least one essential operating element is switched into an operation-ready state B by an event-dependent circuit through at least one event for a period of time, the period of time depending on predefined operating parameters; (c.) either at least one essential operational element is restricted operation state C after passage of time or the essential operational elements are switch to state A before the passage of time and in accordance with step (a.); wherein the means for transmitting authorization data includes a vehicle key through which the authorization data, being encrypted is transmitted to a switching device and subsequently the authorization data is deleted from the key. The use of the key in accord with this claim requires that new authorization data is provided by the key each time the state of the vehicle should be switched back to operating state A, even upon carrying out step (c.).

As for **claim 15**, the prior art of record fails to sufficiently describe or suggest a system for securing a vehicle against theft by means for switching at least one essential operational element of the vehicle, the means for switching comprising at least one usage authorization device (not a vehicle key or fob and remote from the vehicle), at least one switching device for switching between specific operating states of the essential operating elements and means for transmitting the authorization data between the usage authorization device and the switching device wherein: the essential operational elements are each switchable between three operating states A, B, and C; the switching device is connected over at least one operational connection with at least one means each for detecting a switching event wherein at least one of the

operational elements comprises a fluid line in which for blocking the fluid line is disposed a stop valve, which includes a coding or is connected via an operational connection with a stop valve located in a fluid line of an essential drive power train, with the stop valve including a coding which is verifiable by the essential operational element over the operational connection.

Regarding **claim 18**, the prior art of record fails to sufficiently describe or suggest a system for securing a vehicle against theft by means for switching at least one essential operational element of the vehicle, the means for switching comprising at least one usage authorization device (not a vehicle key or fob and remote from the vehicle), at least one switching device for switching between specific operating states of the essential operating elements and means for transmitting the authorization data between the usage authorization device and the switching device wherein: the essential operational elements are each switchable between three operating states A, B, and C with the switching device being connected over at least one operational connection with at least one means each for detecting a switching event and wherein the system includes a code key or code card such that a reading out of a code contained in the code key or code card is only possible with a destruction of the code key or code card, respectively.

These along with further limitations set forth by the claims render the application allowable over the prior art of record.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
